TIME MULTIPLEXED PDV IN HE EXPERIMENTATION

FREQUENCY MULTIPLEXED PDV TESTS

Thierry SOMERLINCK, Virgile GUYOT, Yann PIERRE,
Christian RION, Pierre-Antoine FRUGIER, Patrick MERCIER.

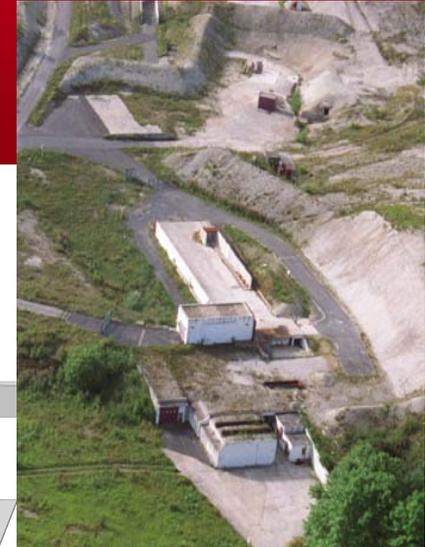

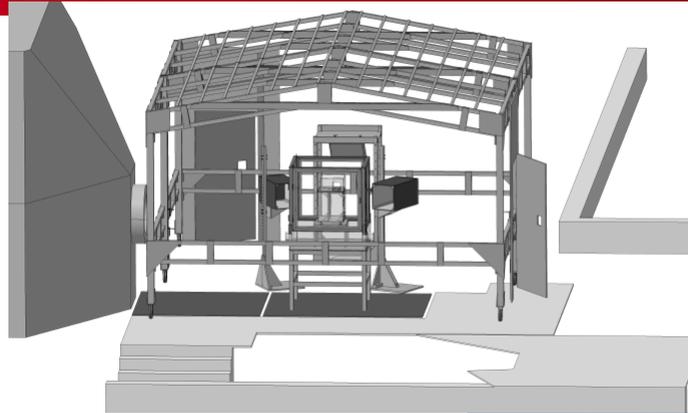

CEA,DAM,DIF

France, 91297 ARPAJON

PDV Workshop

Albuquerque, October 22-23, 2012

- Characterization of new material in HE experimentation
- HE Experimentation setups :
 - High speed frame camera
 - Optical fiber diagnostic (chronometry)
 - PDV measurement
- 4 weeks of preparation
- Team : 4 persons
- Temperature control
- Remote control for each PDV cabinet (over local network)

PDV Cabinet with time multiplexing

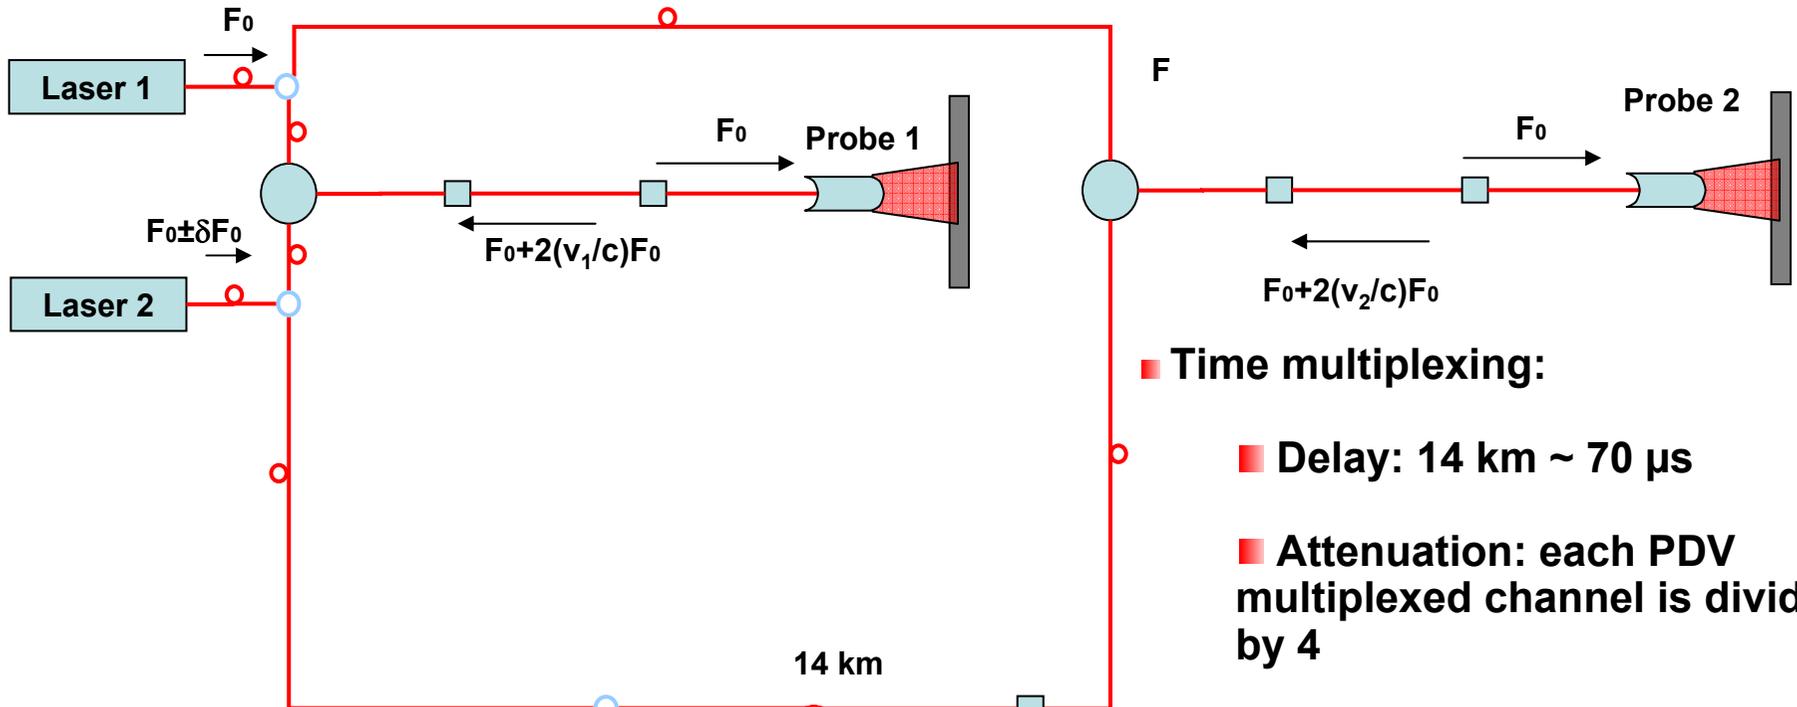

- ← Digitizer Tektronix DPO 71254 or Agilent DSO 91204A
(BW = 13GHz, 50GSa/s) (BW = 12GHz, 40GSa/s)
- ← Greenfield TTL Delay Generator (adjust laser settings)
- ← Keyboard and touchpad
- ← Detectors New Focus (BW = 13 GHz),
Power monitors
Variable optical attenuators
- ← Reference Laser (Pmax =65 mW, $\lambda = 1550$ nm)
- ← Main Laser (Pmax =450 mW / 4, $\lambda = 1550$ nm)
- ← Time multiplexing 2x
(14 km OF, ~ 70 μ s)
- ← Switch Network

IDIL manufacturer

Time multiplexing PDV

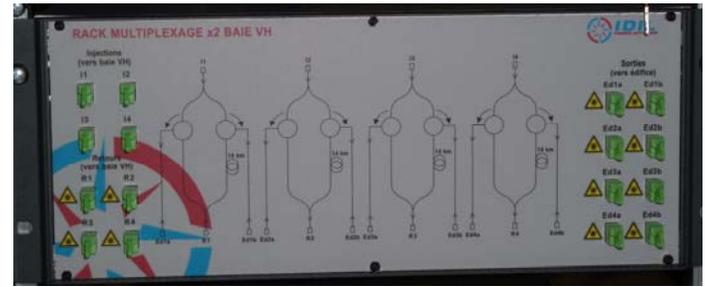

- Time multiplexing:
 - Delay: 14 km ~ 70 μs
 - Attenuation: each PDV multiplexed channel is divided by 4
 - Max: 2 probes / digitizer channel

Detector

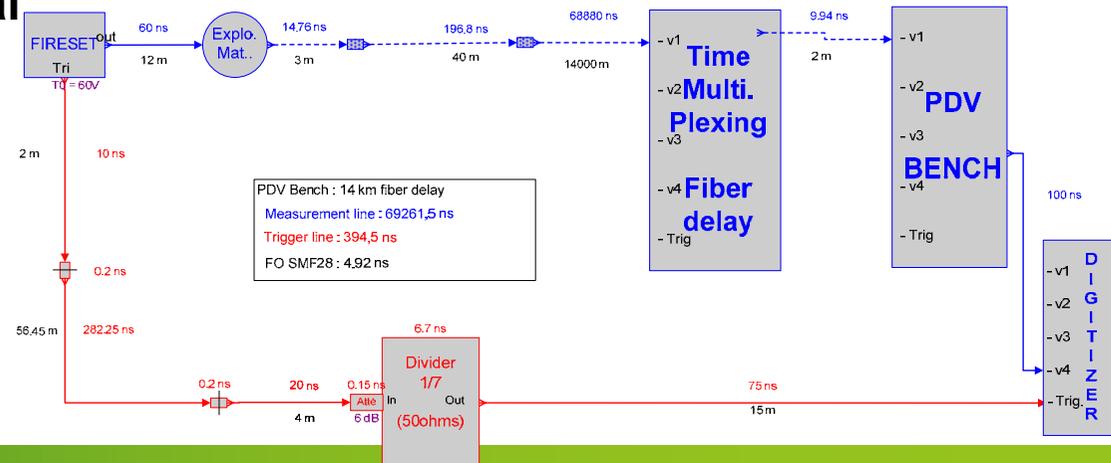

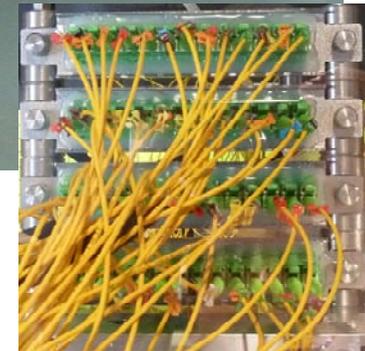

Digitizer

$$|\delta F_0 \pm 2(v_1/c)F_0|$$

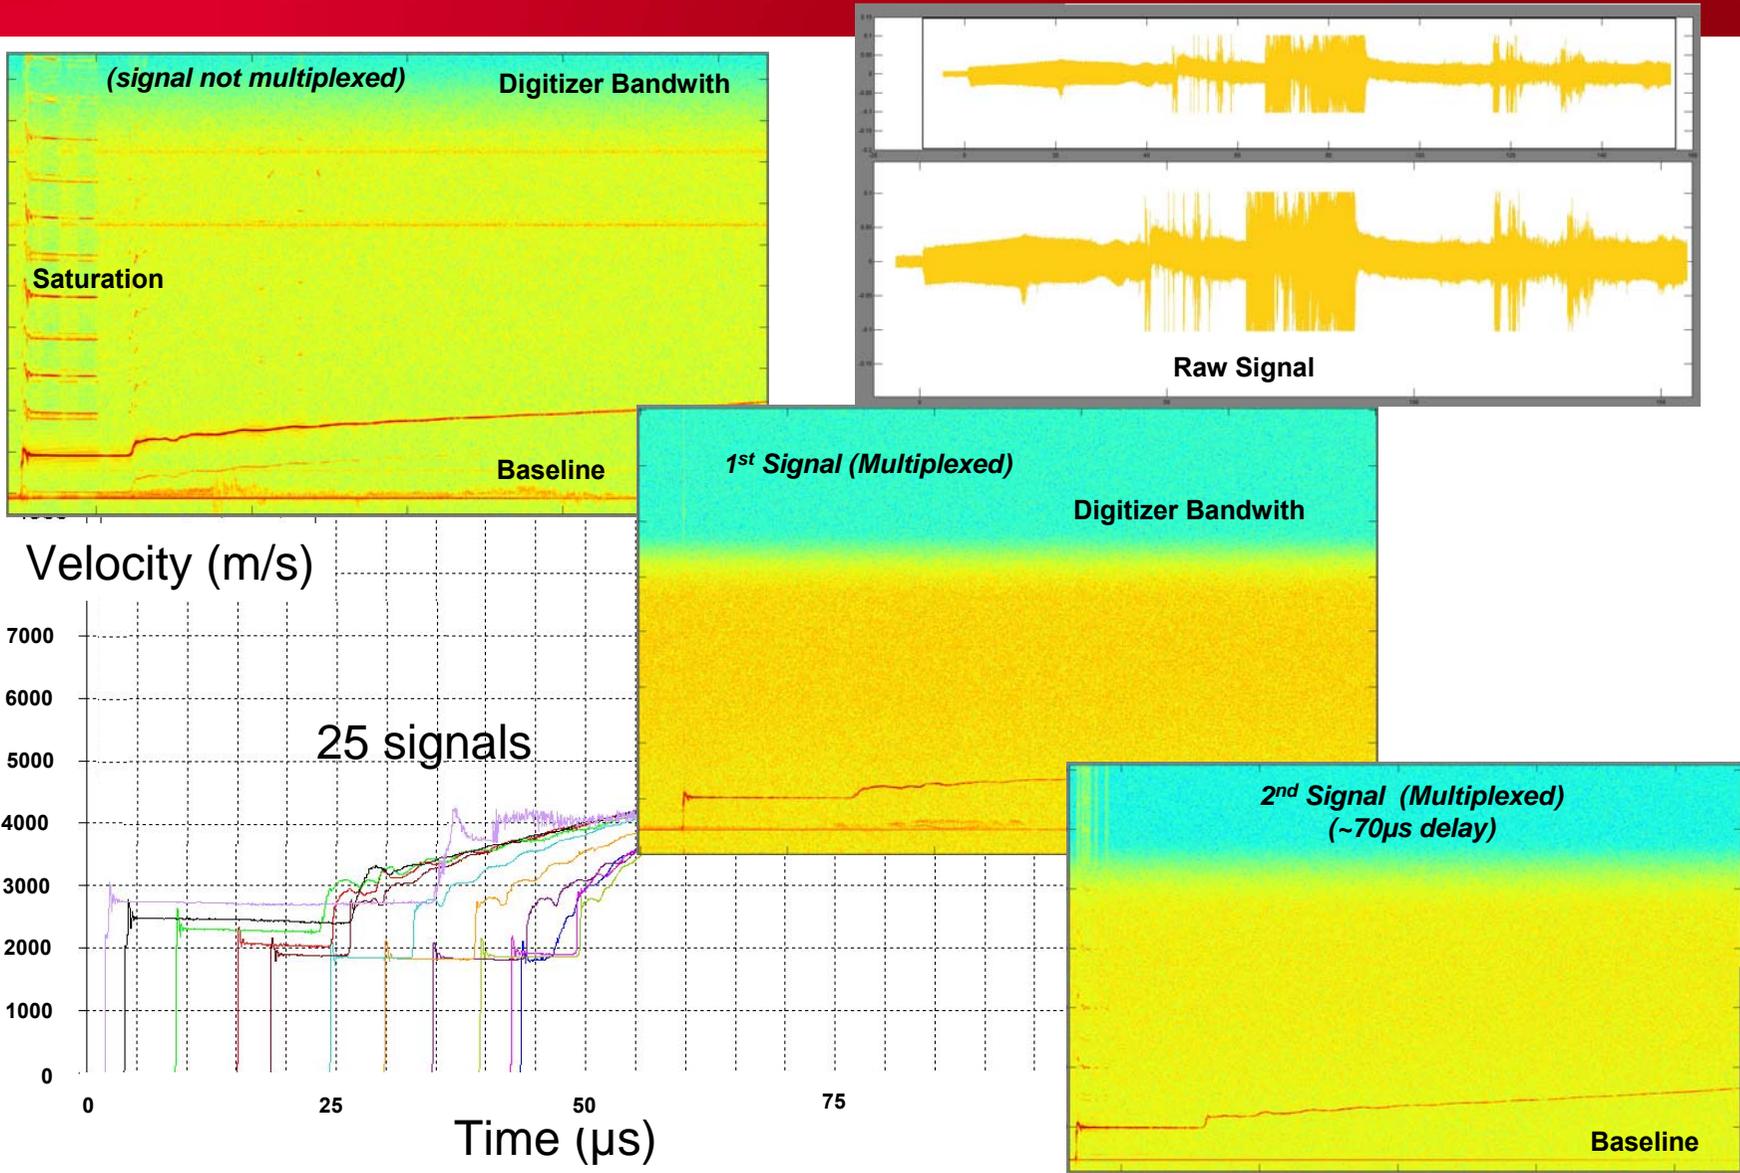

$$|\delta F_0 \pm 2(v_2/c)F_0|$$

- 10 PDV cabinets (IDIL)
- 66 PDV probes recorded: 65/66 useful
 - Uncertainty : 0.010 μ s (16m/s, 2 σ)
 - Long duration : > 50 μ s
 - 80 % of good quality signals
 - 1 lost signal
 - 18 % low quality signal

PDV Signals

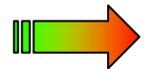

Concluding Remarks...

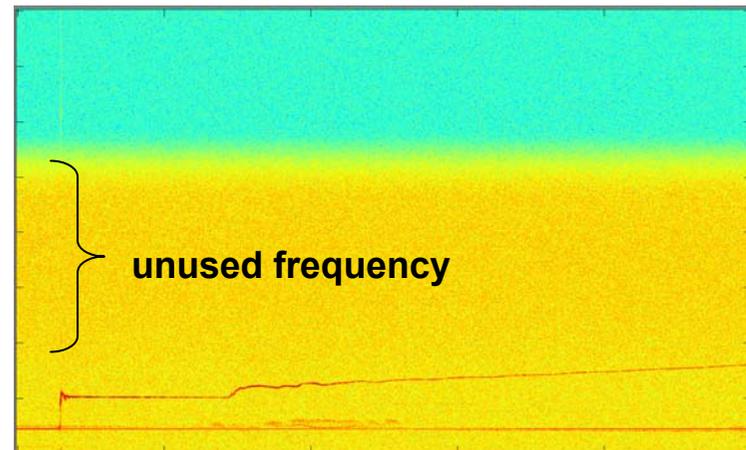

- Time multiplexing increase the number of PDV channels by 2
(2 x 4 digitizer channel x10 cabinets = 80 PDV channels)
- Good signal quality
- Easy to use
- Compact system
- Cost effective

BUT

- Check probe efficiency : signals are divided by 4 for each PDV channel
- Same adjustment for coupled PDV signals

However we still need to increase the number of PDV signals: one solution is frequency multiplexing coupled to time multiplexing

TIME MULTIPLEXED PDV IN HE
EXPERIMENTATION

***FREQUENCY MULTIPLEXED
PDV TESTS***

Frequency PDV Multiplexing Tests

- Main goal: to study 3 frequency multiplexing configurations

- Additional goals:

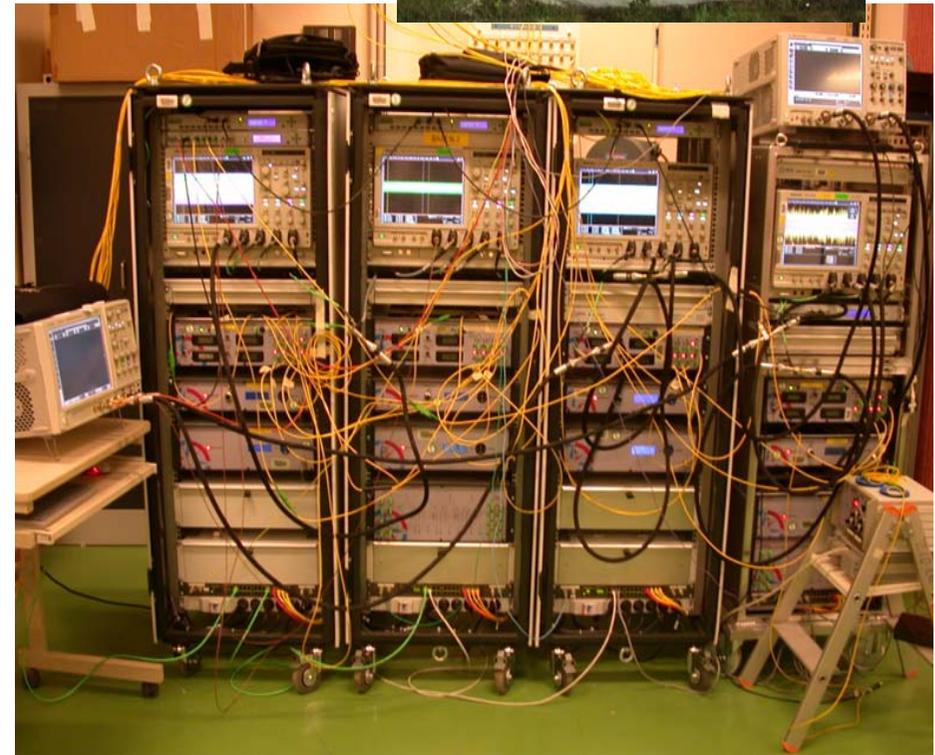

- Laser diode test (IDIL cooperation)

- Test of new digitizer

➡ To cover all of these topics in a single experiment we chose a cylinder test

- No time multiplexing test

- 4 PDV cabinets (3 modified)

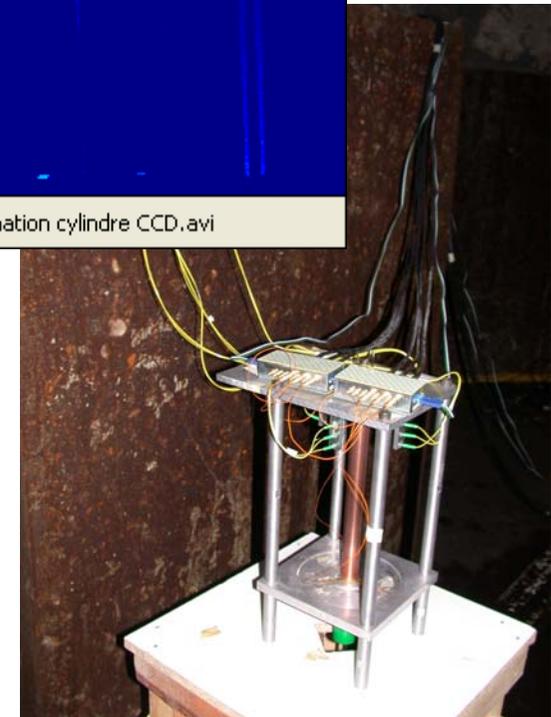

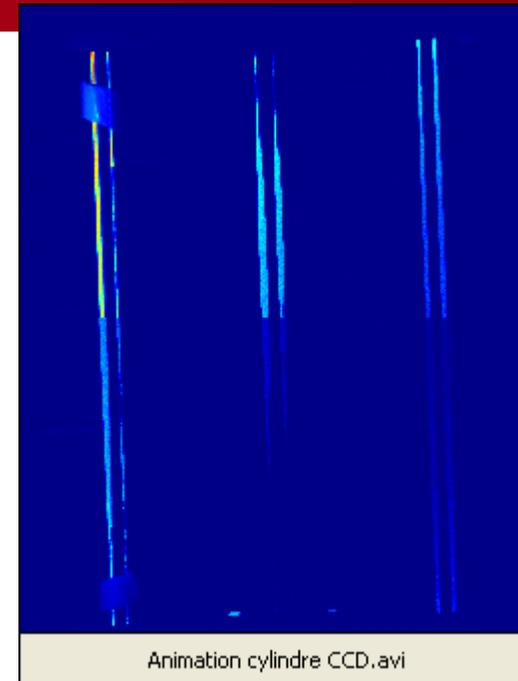

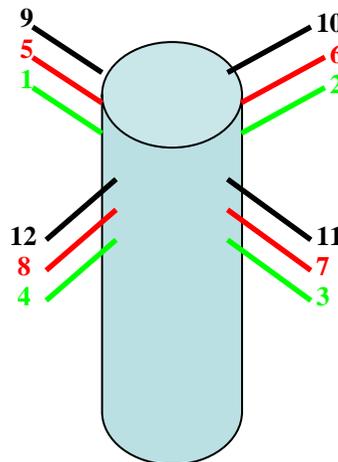

■ Experimental device

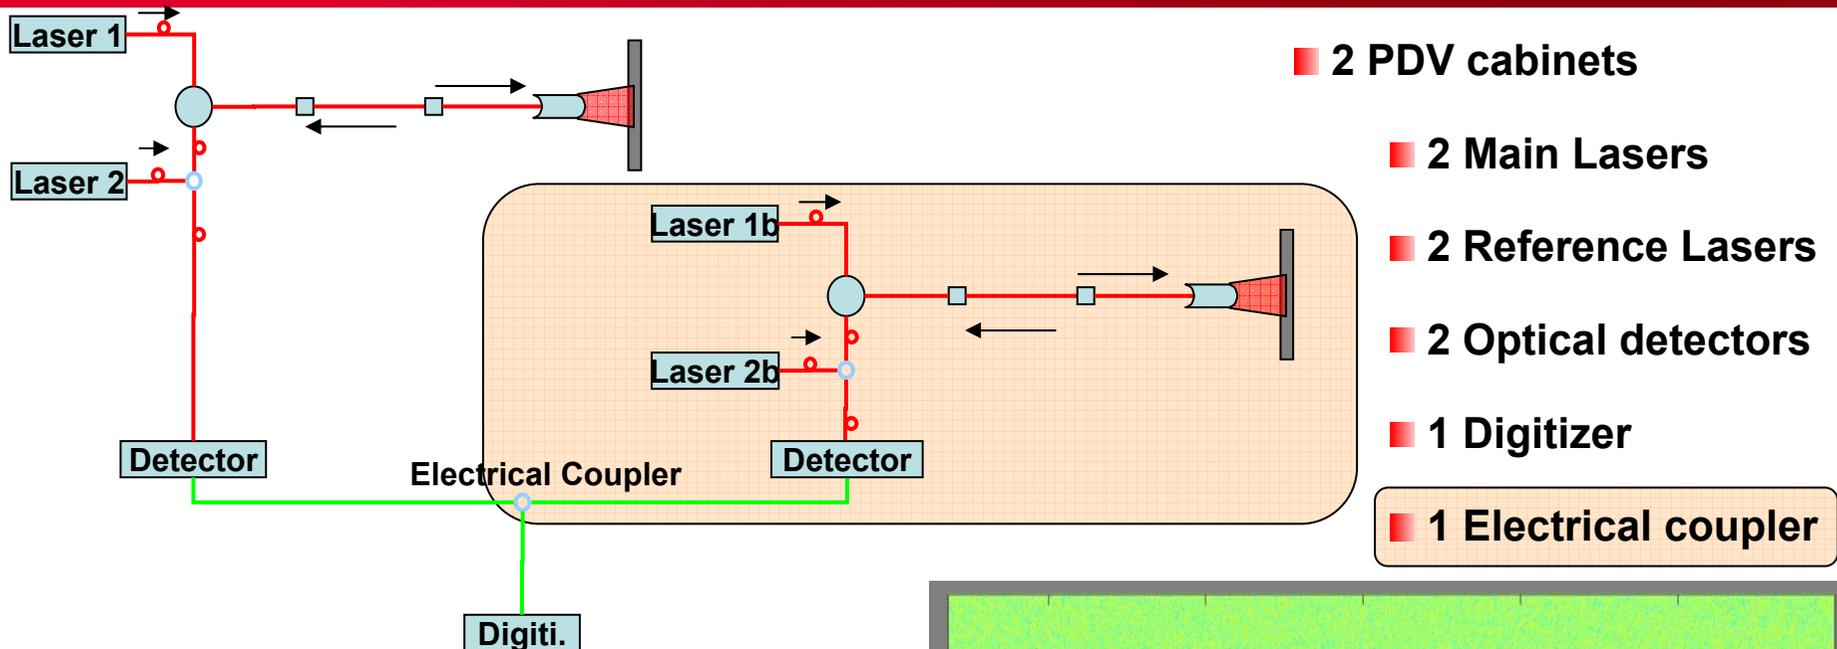

- Copper cylinder (\varnothing 30mm, L 300mm)
- Well known reactive compound: nitromethane

■ Measurement

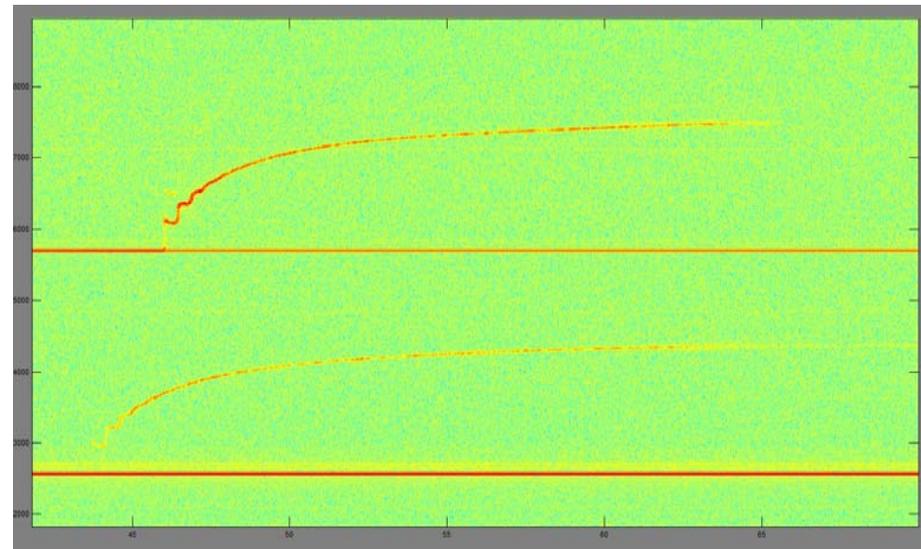

- High speed camera
- 6 electric probes
- 9 PDV probes

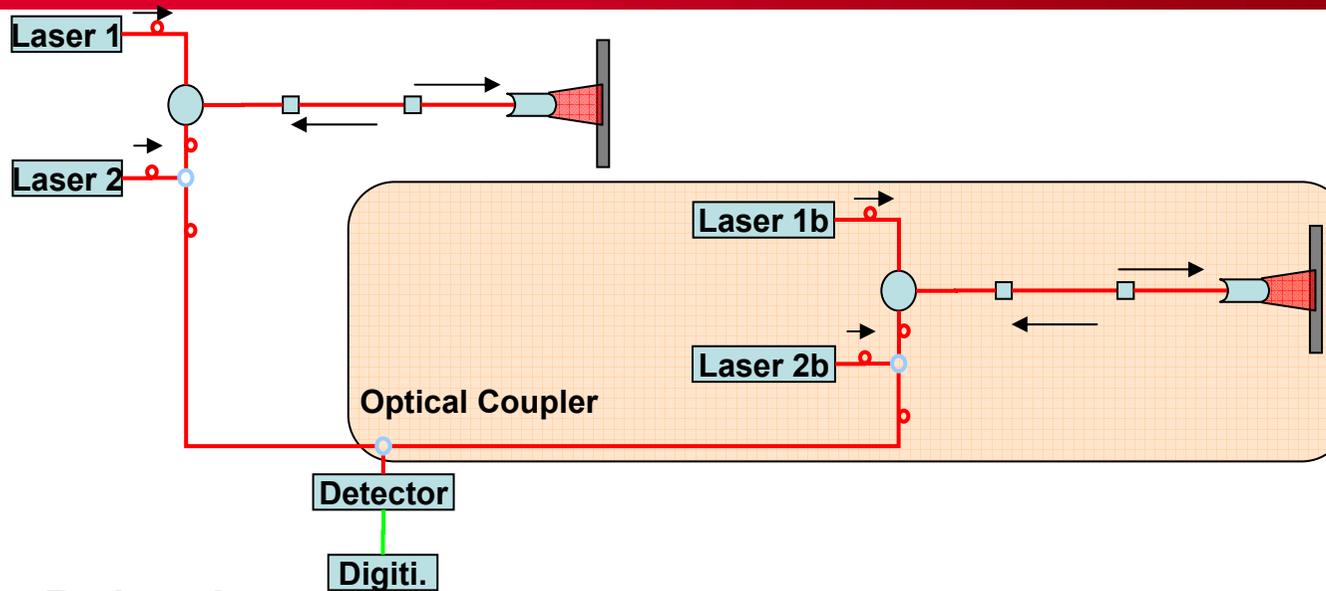

Frequency multiplexing : 1st configuration

- Spectrogram: easy to analyse
 - no crossover if signals known (adapt baselines)
 - Reduced cost
 - Only 1 digitizer channel for 2 optical detectors and 2 PDV channels
- BUT**
- Velocity range reduced by 2

Frequency multiplexing : 2nd configuration

■ 2 PDV cabinets

■ 2 Main Lasers

■ 2 Reference Lasers

■ 1 Optical detector

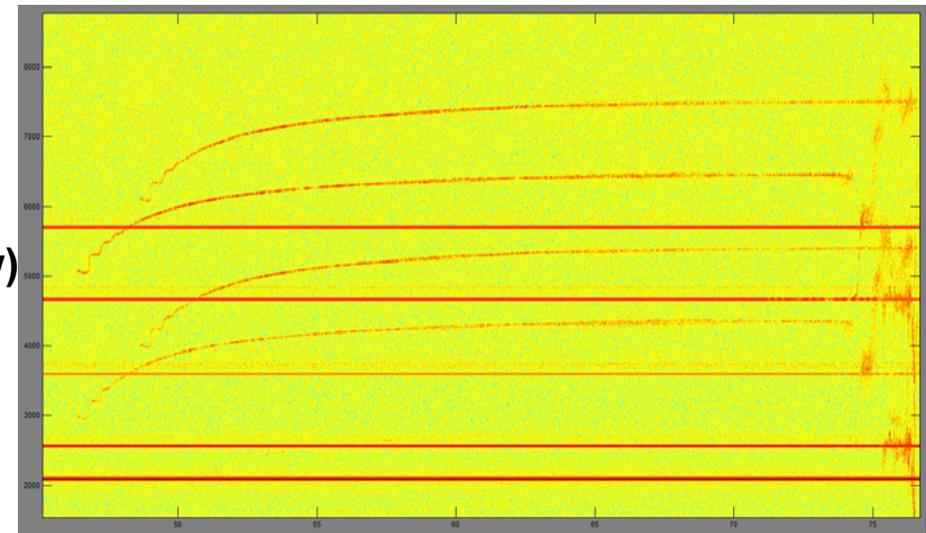

■ 1 Digitizer

■ 1 Optical coupler

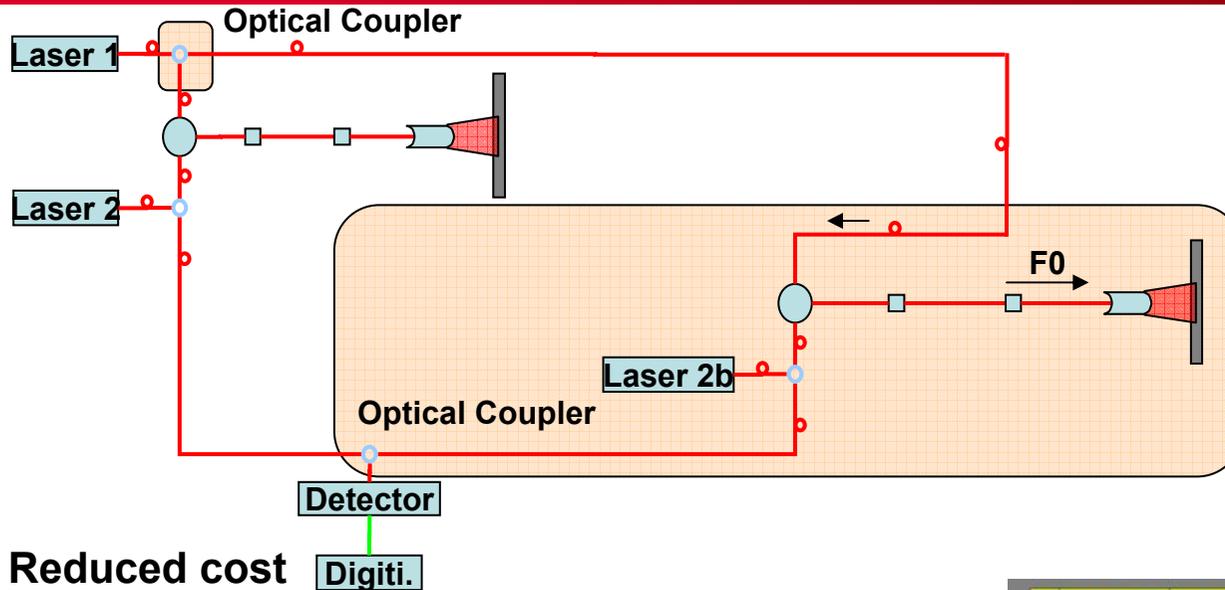

- Reduced cost
 - Only 1 digitizer channel and 1 optical detector for 2 PDV channels

BUT

- Multifrequency crossovers (detector window)
 - Optical power detector limited !
- Spectrogram analysis has become too complex...
- Velocity range reduced by 3 or 4

Frequency multiplexing : 3rd configuration

■ 2 PDV cabinets

■ 1 Main Laser

■ 2 Reference Lasers

■ 1 Optical detector

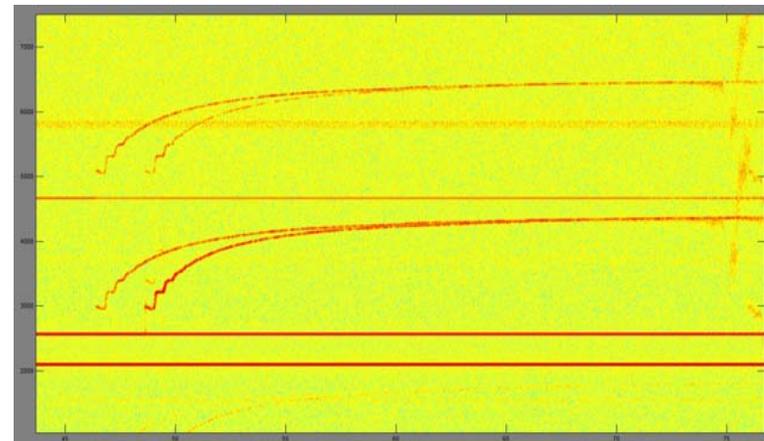

■ 1 Digitizer

■ 2 Optical couplers

- Reduced cost
 - Only 1 main Laser and 1 optical detector

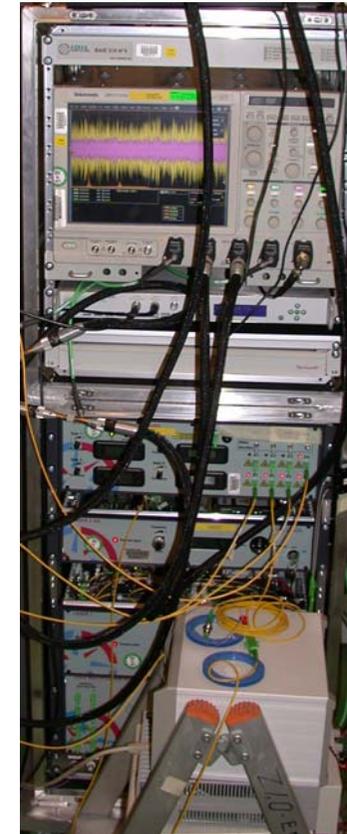

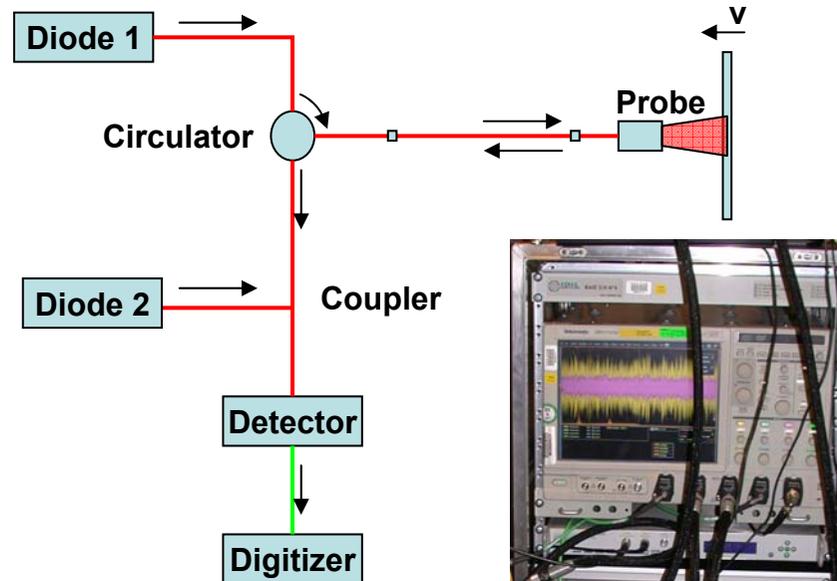

BUT

- Simple frequency crossovers (detector window)
- Velocity range reduce by 2
 - Optical power detector limited
- Spectrogram analysis is made more complex, especially when signals are not known
- Modification of optical connections and main power divided by 2

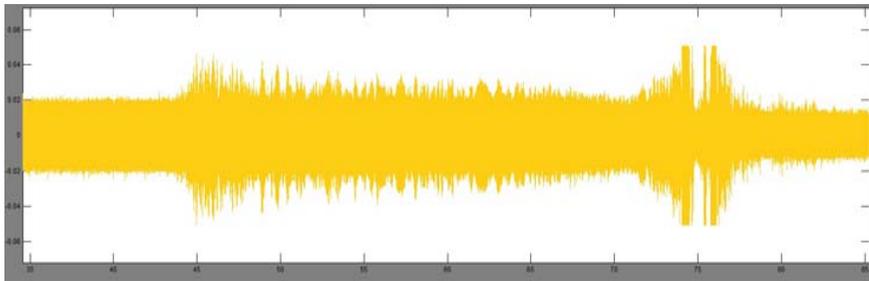

First Diode Laser Test on PDV channel

- **Laser Diode: modified cabinet**
 - **Main Laser: Laser Diode 1**
 - **Reference Laser: Laser Diode 2**
- **Laser Diode characteristics**
 - **Optical power: 10-15 mW**
 - **Wavelength: 1565 nm**
 - **Adjustable Wavelength**

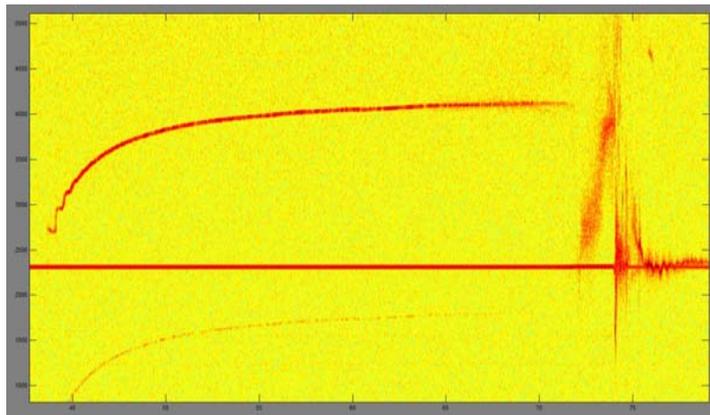

Classic Laser

Raw Signal

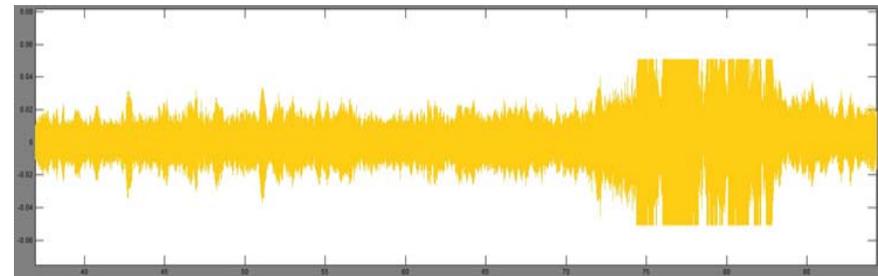

Spectrogram

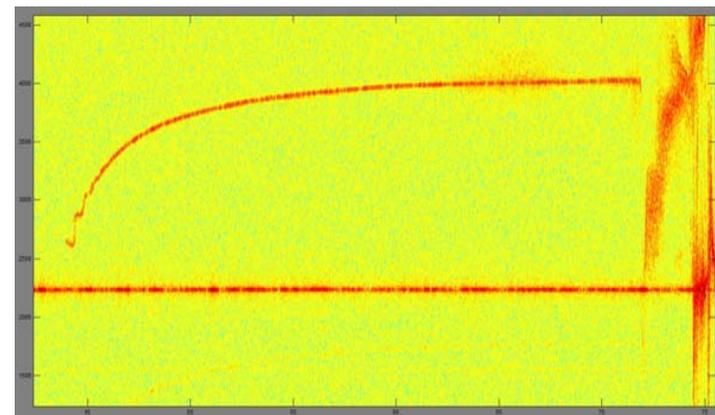

Laser Diode

Raw Signal

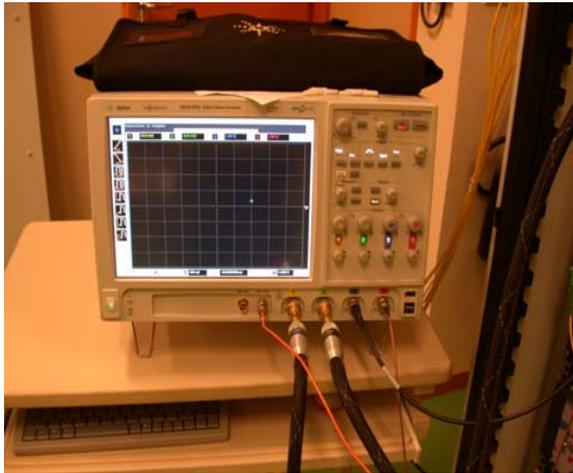

Spectrogram

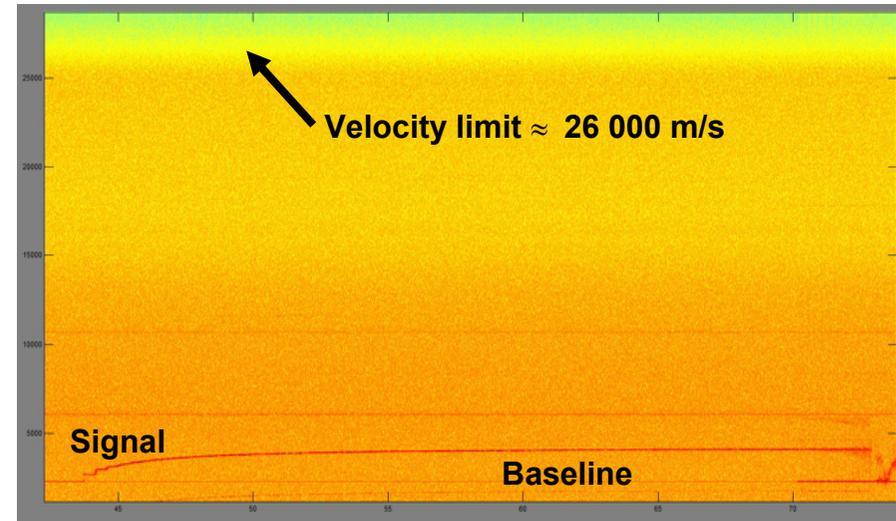

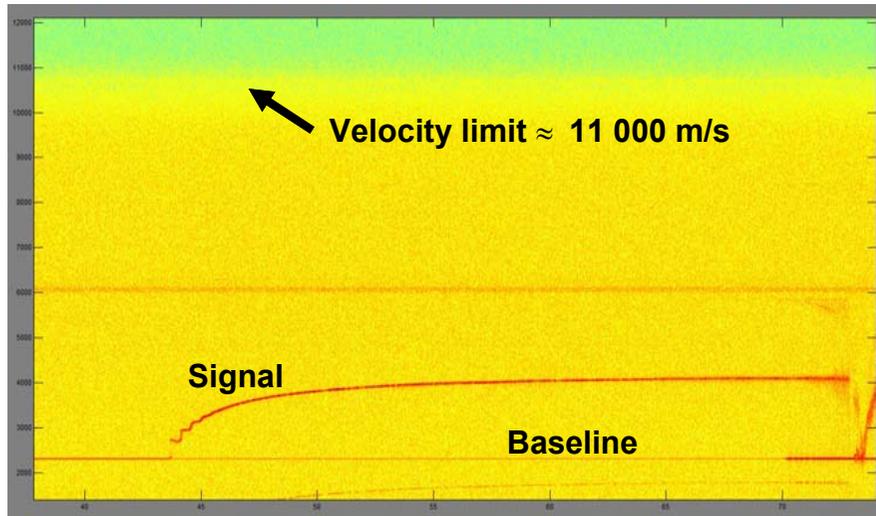

Digitizer Test

Agilent DSO 91204A
12 GHz - 40GSa/s

Agilent DSA X92504A
25GHz - 80GSa/s

- First test on Laser Diode
 - Good results
 - More flexibility to adjust the reference laser
 - 1 Laser diode for 1 PDV channel : adjust each PDV baseline
- ➡ Frequency multiplexing possible
- Digitizer comparison
 - New digitizer : increase velocity range ($> 25\ 000\text{m/s}$)
 - More bandwidth for frequency multiplexing
- ➡ Need large bandwidth optical detector
- Frequency multiplexing:
 - 1st configuration
 - Simple to use, good signal quality
 - 2nd configuration
 - Signal extraction is almost impossible
 - 3rd configuration
 - Investigations have to be performed...
- The first solution, including electrical coupler, is the best way for frequency multiplexing
- The Laser Diode solution allows baseline adjustment for each PDV signal...so for frequency multiplexing !
 - ➡ New IDIL cabinet with 4/8 PDV channels...The first one is on the way...

Thank you for your attention.
